MEMORANDUM

To: Council Members
From: Staff
Date: June 20, 2014 Council Meeting
Subject: Florida Energy Resiliency Report Presentation

Introduction

Staff will present an overview of the Florida Energy Resiliency Report, which was released in December 2013. This report is the result of joint participation by all eleven regional planning councils in the state. In 2011, the U.S. Department of Commerce, Economic Development Administration (EDA) awarded Tampa Bay Regional Planning Council funding for the project. Tampa Bay Regional Planning Council contracted with Council and other regional planning councils to assist with the analysis and data collection in their respective planning areas. The regional planning councils worked together in association with EDA, the U.S. Department of Energy, and the Florida Office of Energy to identify strategies to diversify Florida's energy future and reduce reliance on foreign energy sources. An Executive Summary of the report is attached. The full report is available at www.florida-energy.org.

Recommendation

EXECUTIVE SUMMARY

The Florida Energy Resiliency Report is the first of its kind developed by the Florida’s eleven Regional Planning Councils (RPCs) in their capacity as Economic Development Districts (EDDs). This effort began developing an Energy Resiliency Report in November 2011. This effort was a result of the BP Deepwater Horizon oil spill that led to the discharge of an estimated 206 million gallons of oil into the Gulf of Mexico. The statewide Energy Resiliency Study is about creating a more diverse energy supply and the actions that we take in advance or before an energy event to reduce or minimize the impact of an interruption to the energy supply.

TIMEFRAME
The expansive timeframe of the Energy Resiliency Report allowed the RPCs to thoroughly analyze Florida’s robust energy needs and concerns. Over 3,000 survey results helped create discussions to craft strategies and future scenarios at 9 statewide workshops. Twenty-one Case Studies were analyzed to identify early adopters and programs for new energy resiliency solutions. Confabs and discussions between the RPCs helped develop 27 strategies to help Florida become more energy resilient.

WORKSHOPS
As part of the Energy Resiliency Study, energy workshops were held to determine each Energy Planning Area’s strengths, weaknesses, opportunities, and threats, as well as general happenings in each EPA related to energy. These findings also included relative strengths of each area with respect to renewable and alternative energy technologies.

SURVEYS
Phone and internet surveys were conducted to understand the residential and business price elasticity, temperament towards energy policies, and potential energy-related investments. The surveys interviewed both businesses and residents, which overall indicated that over 50% of Floridians were willing to invest in energy efficiency. Additional guidance was provided by stakeholders from each of five “Energy Planning Areas.”

In order to address the uniqueness of Florida’s regions, we divided up the state into 5 Energy Planning Areas. The EPA’s were divided to align with more appropriate energy resources.

The Panhandle EPA has great wind potential along the 110 corridor and portions of it are in Plant Hardiness Zone 8 which allows for additional trees and biomass vegetation.

The South Florida EPA has access to the gulfstream, a number of islands, and Plant Hardiness Zone 10 which allows for additional trees and biomass vegetation.

The Southwest and Central Florida EPA have access to the gulf, lakes, and available land in their RACEC.

The Tampa Bay/Orlando EPA has access to the I4 Corridor, containing UF, UCF, USF, NASA, Florida Solar Energy Center, etc.
EXECUTIVE SUMMARY

SCENARIO MODELING
Scenario modeling was performed by the regional planning councils to determine the impacts of hypothetical energy or resiliency situations. A dozen hypothetical scenarios were modeled and analyzed using REMI to determine what would happen if the scenario came to fruition. The benefits of the scenarios are of interest to decision makers and Floridians in general. Overall, these scenarios were analyzed with the following results:

Natural Gas Disruption:
This fuel has become increasingly important in Florida, and currently is plentiful and inexpensive. Analysis shows however that a mere six month disruption or period of significant price increase could cause the state to lose $4.2B in Gross Domestic Product in that short timeframe.

Gas Price Increase:
Florida is very dependent on gasoline. Increase prices by 50%-175% for five years and the State loses $288-$828 in Gross Domestic Product.

Renewable Portfolio Standards:
Increase the percentage of renewable fuel sources used in Florida from the current 1% to 10% in five years, and $6B is added to Gross Domestic Product.

Private Energy Market:
An increase in solar installations that added 1% to construction sales and reduced electric costs by .05% each year has only a minimal impact on Gross Domestic Product.

Electric Vehicles:
If 1% of all new vehicles sold in Florida in 2030 were electric, $27M would be added to Gross Domestic Product.

STRATEGY DEVELOPMENT
Strategy development and implementation steps were the final steps in the strategy. Over 27 strategies were created to address the issue of energy resiliency in Florida. Once implemented, this preparation will counter concerns related to Florida’s energy vulnerability.

The top five strategies were ranked by ease of implementation, as shown below. All these strategies were deemed to be easy or moderate to carry out, and could be implemented by different stakeholders through facilitation by Regional Planning Councils. The majority of these strategies also have a strong outreach and educational component, and some might require changes to local policies and ordinances.

STRATEGY
1. Provide comprehensive education on the goals, costs and benefits, obstacles, and quality of life implications related to energy efficient community design and planning.

2. Adopt a broad-based program to promote efficiency and conservation using all available tools, and market a consistent message of energy efficiency and conservation through comprehensive planning and school district curricula.

3. Continue to conduct public opinion polling and economic modeling to support the adoption of renewable energy goals by the state and its public and private partners.

4. Develop and encourage Property Assessed Clean Energy (PACE) and other locally established financing programs for energy efficiency, energy conservation, and energy generation improvement programs and make available to all sectors (residential, commercial, industrial, government, institutional, etc.).
